

AdVision — Multi-Client Ad Performance Dashboard

Marketing Analytics | Tools: Power BI, Windsor.ai, DAX, Power Query

Objective

Build a single, real-time Power BI dashboard that reports multi-platform ad campaign performance for multiple clients at once, replacing manual spreadsheet reporting.

Business Problem

Crocple Internet manages Google Ads, Meta Ads and LinkedIn Ads campaigns for many clients. Reporting was done manually in spreadsheets for each client every week - slow, error-prone and impossible to scale across 9 clients at once.

Dataset

Multi-platform ad campaign data (Google Ads, Meta Ads, LinkedIn Ads) for 9 clients, pulled through Windsor.ai into a unified data model covering spend, leads, clicks, impressions and conversions.

Data Preparation

- Connected and blended Google Ads, Meta Ads and LinkedIn Ads data via Windsor.ai
- Built Power Query transformations to standardize campaign, client and date fields across platforms
- Modeled a scalable star schema to support 9 clients from a single dataset
- Handled missing/blank spend and lead values without breaking rollups

Analysis Performed

- Real-time CPL (cost-per-lead) tracking by client, platform and campaign
- Budget pacing against monthly targets
- Cross-platform performance comparison (Google vs Meta vs LinkedIn)
- Conditional-formatting KPI cards to flag under/over-performing campaigns at a glance

Key KPIs

Spend · Leads · CPL · Budget Pacing % · Clicks · CTR

Key Insights

- Centralizing 9 clients into one model cut manual weekly reporting effort dramatically.
- Conditional formatting made budget-pacing issues visible immediately instead of at month-end.
- Cross-platform CPL comparison surfaced which channel was most efficient per client.

Recommendations

- Shift more monthly budget toward the lowest-CPL platform per client.
- Set automated pacing alerts so under-spending campaigns are caught mid-month, not after.
- Standardize campaign naming across platforms to keep the model clean as new clients are added.

Skills Demonstrated

DAX, Power Query, Data Modeling, Dashboard Development, Multi-source Integration, CPL Analysis
