

CRM Sales Pipeline Dashboard

Sales Analytics | Tools: Power BI, DAX, Power Query

Objective

Build a Power BI dashboard analyzing a CRM sales pipeline to track deal flow, stage conversion and sales performance.

Business Problem

Sales teams often lack visibility into where deals stall in the pipeline and which reps or stages are driving (or blocking) revenue - this project simulates that scenario using a realistic synthetic dataset.

Dataset

A synthetic CRM dataset of 1,400 deals covering deal stage, owner, value, close date and win/loss outcome.

Data Preparation

- Designed and generated a realistic 1,400-deal CRM dataset
- Cleaned and structured stage, owner and outcome fields
- Built DAX measures for pipeline value, win rate and stage conversion

Analysis Performed

- Pipeline funnel by stage
- Win rate by sales rep and deal source
- Average deal size and sales cycle length
- Revenue forecast based on weighted pipeline value

Key KPIs

Pipeline Value · Win Rate · Average Deal Size · Sales Cycle Length

Key Insights

- A small number of reps closed a disproportionate share of high-value deals.
- Certain stages showed significantly longer dwell time, indicating a bottleneck.
- Win rate varied meaningfully by deal source, pointing to where lead quality was strongest.

Recommendations

- Focus coaching on the pipeline stage with the longest dwell time.
- Prioritize lead sources with the highest historical win rate.
- Use weighted pipeline value, not raw pipeline value, for forecasting.

Skills Demonstrated

DAX, Data Modeling, Sales Funnel Analysis, Forecasting, Dashboard Development
