

Prestige University — Lead Generation Analytics

Education Analytics | Tools: Power BI, Excel, DAX, Power Query

Objective

Turn a large, manually maintained lead feedback workbook into a reliable Power BI model that tracks valid leads and lead-stage progression accurately.

Business Problem

Prestige University's lead data lived across a 16-sheet Excel feedback workbook with inconsistent stage labels, making it hard to know how many leads were genuinely valid or where they dropped off in the funnel.

Dataset

A 16-sheet Excel workbook of lead feedback data covering lead source, stage, application status and follow-up outcomes.

Data Preparation

- Consolidated 16 separate sheets into a single clean data model
- Built DAX measures for valid lead counts and valid lead percentage
- Created a custom 8-day week segmentation in Power Query to match the university's reporting cadence
- Replicated the existing Google Sheets pivot structure as a Lead Stage Wise matrix in Power BI

Analysis Performed

- Valid vs invalid lead breakdown
- Lead Stage Wise funnel matrix (inquiry through to application)
- Weekly lead volume using the custom 8-day segmentation
- Source-wise lead quality comparison

Key KPIs

Total Leads · Valid Leads · Valid Lead % · Applications · Weekly Lead Volume

Key Insights

- A meaningful share of raw leads were invalid or duplicate - the valid-lead measure gave a much more accurate funnel view.
- The custom week segmentation matched internal reporting cycles far better than a standard calendar week.
- The Lead Stage Wise matrix made it easy to see exactly where leads stalled in the funnel.

Recommendations

- Automate the 16-sheet intake process to reduce manual consolidation each cycle.
- Use the valid-lead measure as the primary KPI reported to stakeholders, not raw lead count.
- Focus follow-up resources on the funnel stage with the highest drop-off.

Skills Demonstrated

DAX, Power Query, Data Cleaning, Funnel Analysis, Excel Data Consolidation, Dashboard Development
